

the thing is that if you build the semi-natural pool in the middle of the appartement, it will totally change the character of the place, nila raised as an objection

with the one of six wanting to be visitors who brought the idea up thinking about it for a moment and then saying in a soft melodious voice... you are so right nila, i have not thought about the importance for emptiness, nothingness in the research for the advancement of cellular structures what good would it do to take away the center piece of the appartement what allows the built up energies in the experiments along the walls to flow into each other aetherically

added the one who introduced herself as monica

an other one of the six aspiring newcomers, fernando, did add... i can only support to keep the appartement as uncrowded and as least stuffed with fixed installations as possible, i have seen your running and hiding chasing each other playfully around at the place luoma and nila and it seemed to me an important part of the integration for your newly reached cell evolution...

luoma... as you said ascende... the ones who are here at the moment who are accepted members of the research enterprise, have full power to decide after hearing all of your inputs and monicas generous offer to finance the construction of the semi-natural indoor pool... we might find a place beside the existing bathtube along the walls

...ascende... and eventually when the plant and sand filter systems will be in harmonious tune to provide the pool with a sufficient water quality, we or the ones who at this moment live in the appartement... might decide that there is no more need for fresh water pipes and emaille bath tubes ... as the informations in the semi-natural pools are highly valuable contributing to the cell growth of the ones bathing in it...

mundu... makes me think of mix combinations from microalgae with humanimalplant cells from the petri dishes living on in there continuously digesting and upcycling fresh input by the sweat of the experimenters fernando being excited now... i am a dancer and so are ava and rumu too who would like to apply to be among the next researchers and experimenters in paris... we will certainly sweat alot while dancing with each other, looking singing enchanting the many coloured microalgae transparent seetrough bioreactors... i can think of us drinking the microalgae alive fresh watery juice and sweating it refined out, then bathing in the pools, cuddling each other while laying in the pool

luoma... that sounds very contributing to our goal of integration and adaptation towards the merge of all kinds of living organism, i am sure we will have great dancing, bathing, enchanting and mentally imagineering times together

...so fernando, ava and rumu were accepted by luoma as the next fellow appartement-mates and research colleagues, with the other three now introducing themselves

there was michael, suleiman and li who were freshly finished with their studies at the university, michael a 30 year old doctor of human medicine, suleiman 28 years old a

molecular biologist and li 29 having a graduate in plant anatomy they were living together in a rented flat in mumbai

where their parents had financed their studies
their parents were not poor but neither rich, with all of them providing
their children with the liberty to proceed after their studies how they
felt suiting their personal taste of life
as they were accustomed to the kind of rational dominating thinking and
secondhand information processing via textbooks, they volunteered to focus
their attention onto the documentation of what happened so far in the
parisian appartement in terms of reproducible methods ... how to grow a set
of multispecies cells to print the flesh of my pinted at home android
companion... as the overall theme...

perma was very happy for them to offer their rational discipline, saying...
we sure could use some cool look at all the many-leveled multidimensional
progresses we achieved till now... nila supporting that and adding... and
you might find yourselves being supported by the dancing bathing body voice
experiments of fernando, ava and rumu in the way like a wealthy person
enjoys seeing live dance and music performance while eating...

with suleiman answering,... might be so, but there is still the balcony to
get away when the dynamics get that hot it would make it difficult not to
partake fully in it mentally... with li and michael both supporting michael
in adding in a happy smiling tone... and we might even put earplugs in when
the kissing and fumbling or orgasmic cries from luoma, fernando, ava and
rumu get overwhelming... this causing all of the now videoconferencing to
laugh out healthily

adcende and perma then said goodbye for this moment as they wanted to catch
some hours of sleep before landing in the south east asian region
mundu also only a few hours away from landing in the congo bassin started
to chat with nila who was on the plane to the foresty lowlands of southern
america, the amazons...

he asked her... what do you think will the elders of the tribes who live
in the forest answer us when we ask them for the admission to research in
their territories... with nila replying... there might be all kind of
different views onto our quest, we might be thoroughly examined on behalf
of our intentions and motivations... will the androids robot companions
designed to help humanity, will have an understanding of the native tribes
wish to continue a most undisturbed traditional lifestyle of sustainably
living of the forests offerings... some elders might tell us that we might
support their land securing efforts with providing finances and as welcome
guests may tour the area guided by the members of their tribe, but how we
would sample genetic informations and use them for whatever purpose, that
would be solely our own responsability

...mundu... you do not think they would find it against nature or ethos to
gather life informations with the goal of helping new life forms to spring
forth?... nila... naah... i do not see that coming as we will explain them
how we lived together in paris

treating the animal and plant cell samples with greatest gentleness,
respect, appreciation... and that we are striving for helping to create
many hundred thousands or millions of androids who will be given to the
landless, indebted, enslaved in too demanding and underrewarded jobs....
that the androids our research aims to make possible will actually be given
to the very people who come now to fell the trees and wash out the forest

grounds in search for minute amounts of gold
this people then might quit their low paid forest destructing employments
and instead sit together with their android companions to show them how to
weave blankets, swinging hammocks... build pots and vessels from clay or
press banana leaves into temporary usable plates, knives and forks, they
might sell their wares directly via the internet to near or far away
customers... others might decide to travel helping customers to build cobb
buildings, using earth and straw, fallen tree branches and locally abundant
ressources to build houses...

again others might offer in union with their allways to the net connected
android companion consulting services, on any topic starting from humans
body health towards governing their local community...

when mundu adds... as for the allways connected on the net, i believe that
there are two approaches, one with satelites we eventually transport up in
the earths orbit ourselves once the crowdfunding and delivery of the first
batch of android helpers successfully happened... and the other component a
one-to-the-next relaying broadband radio wave packet transmission
technology what would allow the androids to share access to the global net
also in case there would be no satelites... when nila cautions... but
allways on would eventually be of a disturbance to the natural ambience of
a mostly wild place where for example an android would be taken with or go
there for its own personal research and individual growth... mundu
agreeing... we could design the radio waves following the insights we gain
from the cell merging processes...

ascende being woken up by the landing preparations on board of the
aeroplane he travelled with, jumped into their exchange... i have just now
followed your last sentence mundu, probably the rational observations and
documentary approach of michael, li and suleiman might show us how these
kind of more organic natural or near to natural antennas might be built...
nila... or saying... what kind of cellular combinations could grow into
such information sending and receiving organs...

perma also awake now... mmmhh... eventually we might find a whole new
approach of growing bones and flesh tissues ... the cell printing 3d
printer instructions eventually being less top down deciding how to lay
cells onto each other but listening somehow to the growing dynamics of the
living micro units itself
